

HW 1

MSDS697, Diane Woodbridge

Description

Assuming that you have a mongo database called “msds697” and a collection called “business”, complete the hw1.js. (You can import the given “business.json” for this assumption, but do not include the mongoimport command in the code.)

- 1) Insert a new document called “new_restaurant” to “business” – 0.5 pt
- 2) For all the documents, add a new field “validated” and set its binary value to be *true*. – 0.5 pt
- 3) For all the documents, drop the field name “restaurant_id”. – 0.5 pt
- 4) For all the documents, change field name “borough” to “district”. – 0.5 pt
- 5) Find all the businesses where its “coord” is [-73.871194, 40.6730975] without “_id” (Indented format – using `.pretty()`). This entry should have all the respective updates made above. – 0.5 pt

Submit the hw1.js file (**ONLY**)- the name of your file should be hw1_Lastname_Firstname.js.

If you run `mongo < hw1.js > output`, the output should be same as the given output file except for the first 4 lines.

Note : Make sure to keep the given codes in your .js file. (0.5 pt)
